|--------|---|---|-------------------|----------------------|--|----------|--|---|--|
| 1      | 4e(i)                                     | The software is developed and built in secure environments. Those environments are secured by the following actions at a minimum:   | Functional        | Intersects With      | Development & Test<br>Environment<br>Configurations                      | CFG-02.4 | Mechanisms exist to manage baseline<br>configurations for development and test<br>environments separately from operational<br>baseline configurations to minimize the risk of                  | 5   |  |
| 1      | 4e(i)                                     | The software is developed and built in secure environments. Those environments are secured by the following actions at a minimum:   | Functional        | Subset Of            | Secure Development<br>Environments                                       | TDA-07   | Mechanisms exist to maintain a segmented development network to ensure a secure development environment.   | 10  |  |
| 1      | 4e(i)                                     | The software is developed and built in secure environments. Those environments are secured by the following actions at a minimum:   | Functional        | Intersects With      | Separation of<br>Development, Testing and<br>Operational<br>Environments | TDA-08   | Mechanisms exist to manage separate development, testing and operational environments to reduce the risks of unauthorized access or changes to the   | 5   |  |
| 1      | 4e(i)                                     | The software is developed and built in secure environments. Those environments are secured by the following actions at a minimum:   | Functional        | Intersects With      | Secure Migration<br>Practices  | TDA-08.1 | Mechanisms exist to ensure secure migration<br>practices purge Technology Assets,<br>Applications and/or Services (TAAS) of<br>test/development/staging data and accounts                      | 3   |  |
| 1.a    | 4e(i)(A)                                  | Separating and protecting each environment involved in developing and building software;  | Functional        | Subset Of            | Secure Development<br>Environments                                       | TDA-07   | Mechanisms exist to maintain a segmented development network to ensure a secure development environment.   | 10  | Example 1: Use multi-factor, risk-based authentication and conditional access for each environment.  Example 2: Use network segmentation and access controls to separate the environments from each other and from   |
| 1.a    | 4e(i)(A)                                  | Separating and protecting each environment involved in developing and building software;  | Functional        | Intersects With      | Separation of<br>Development, Testing and<br>Operational<br>Environments | TDA-08   | Mechanisms exist to manage separate development, testing and operational environments to reduce the risks of unauthorized access or changes to the   | 8   | Example 1: Use multi-factor, risk-based authentication and conditional access for each environment.<br>Example 2: Use network segmentation and access controls to separate the environments from each other and from |
| 1.b.   | 4e(i)(B)                                  | Regularly logging monitoring and auditing trust relationships used for authorization and access:  | Functional        | Subset Of            | Continuous Monitoring  | MON-01   | Mechanisms exist to facilitate the implementation of enterprise-wide monitoring controls.  | 10  | to separate the environments from each other and from  |
| 1.b.   | 4e(i)(B)                                  | Regularly logging monitoring and auditing trust relationships used for authorization and access:  | Functional        | Intersects With      | Content of Event Logs  | MON-03   | Mechanisms exist to configure Technology Assets, Applications and/or Services (TAAS) to produce event logs that contain sufficient information to, at a minimum:                               | 5   |  |
| 1.b.   | 4e(i)(B)                                  | Regularly logging monitoring and auditing trust relationships used for authorization and access:  | Functional        | Intersects With      | Audit Trails   | MON-03.2 | Mechanisms exist to link system access to individual users or service accounts.  | 5   |  |
| 1.b.i  | 4e(i)(B)                                  | to any software development and build environments; and   | Functional        | Intersects With      | Inbound & Outbound<br>Communications Traffic                             | MON-01.3 | Mechanisms exist to continuously monitor<br>inbound and outbound communications traffic<br>for unusual or unauthorized activities or<br>conditions.  | 5   |  |
| 1.b.i  | 4e(i)(B)                                  | to any software development and build environments; and   | Functional        | Intersects With      | System-Wide / Time-<br>Correlated Audit Trail                            | MON-02.7 | Automated mechanisms exist to compile audit records into an organization-wide audit trail that is time-correlated.   | 5   |  |
| 1.b.ii | 4e(i)(B)                                  | among components within each environment;   | Functional        | Intersects With      | System Generated Alerts  | MON-01.4 | Mechanisms exist to generate, monitor,<br>correlate and respond to alerts from physical,<br>cybersecurity, data protection and supply<br>chain activities to achieve integrated                | 5   |  |
| 1.b.ii | 4e(i)(B)                                  | among components within each environment;   | Functional        | Intersects With      | System-Wide / Time-<br>Correlated Audit Trail                            | MON-02.7 | Automated mechanisms exist to compile audit<br>records into an organization-wide audit trail<br>that is time-correlated.   | 5   |  |
| 1.c    | 4e(i)(C)                                  | Enforcing multi-factor authentication and conditional access across the environments<br>relevant to developing and building software in a manner that minimizes security risk;                        | Functional        | Equal                | Multi-Factor<br>Authentication (MFA)                                     | IAC-06   | Automated mechanisms exist to enforce Multi-<br>Factor Authentication (MFA) for:<br>(1) Remote network access;<br>(2) Third-party Technology Assets,   | 10  |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Subset Of            | Technology Development<br>& Acquisition                                  | TDA-01   | Mechanisms exist to facilitate the implementation of tailored development and acquisition strategies, contract tools and procurement methods to meet unique                                    | 10  |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Product Management   | TDA-01.1 | Mechanisms exist to design and implement<br>product management processes to proactively<br>govern the design, development and<br>production of Technology Assets, Applications                 | 8   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Minimum Viable Product<br>(MVP) Security<br>Requirements                 | TDA-02   | Mechanisms exist to design, develop and<br>produce Technology Assets, Applications<br>and/or Services (TAAS) in such a way that risk-<br>based technical and functional specifications         | 8   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Ports, Protocols &<br>Services In Use                                    | TDA-02.1 | Mechanisms exist to require the developers of<br>Technology Assets, Applications and/or<br>Services (TAAS) to identify early in the Secure<br>Development Life Cycle (SDLC), the functions,    | 5   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Functional Properties  | TDA-04.1 | Mechanisms exist to require software<br>developers to provide information describing<br>the functional properties of the security<br>controls to be utilized within Technology                 | 5   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Developer Architecture &<br>Design                                       | TDA-05   | Mechanisms exist to require the developers of<br>Technology Assets, Applications and/or<br>Services (TAAS) to produce a design<br>specification and security architecture that:                | 8   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Secure Settings By<br>Default  | TDA-09.6 | Mechanisms exist to implement secure configuration settings by default to reduce the likelihood of Technology Assets, Applications and/or Services (TAAS) being deployed with                  | 5   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Criticality Analysis   | TDA-06.1 | Mechanisms exist to require the developer of<br>the Technology Asset, Application and/or<br>Service (TAAS) to perform a criticality analysis<br>at organization-defined decision points in the | 5   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Threat Modeling  | TDA-06.2 | Mechanisms exist to perform threat modelling<br>and other secure design techniques, to ensure<br>that threats to software and solutions are<br>identified and accounted for.                   | 5   |  |
| 1.d    | 4e(i)(D)                                  | Taking consistent and reasonable steps to document as well as minimize use or inclusion of<br>software products that create undue risk within the environments used to develop and build<br>software; | Functional        | Intersects With      | Software Assurance<br>Maturity Model (SAMM)                              | TDA-06.3 | Mechanisms exist to utilize a Software Assurance Maturity Model (SAMM) to govern a secure development lifecycle for the development of Technology Assets,                                      | 3   |  |
| 1.e    | 4e(i)(E)                                  | Encrypting sensitive data such as credentials to the extent practicable and based on risk;  | Functional        | Subset Of            | Use of Cryptographic<br>Controls   | CRY-01   | Mechanisms exist to facilitate the<br>implementation of cryptographic protections<br>controls using known public standards and<br>trusted cryptographic technologies.                          | 10  |  |
| 1.e    | 4e(i)(E)                                  | Encrypting sensitive data such as credentials to the extent practicable and based on risk;  | Functional        | Intersects With      | Minimum Viable Product<br>(MVP) Security<br>Requirements                 | TDA-02   | Mechanisms exist to design, develop and<br>produce Technology Assets, Applications<br>and/or Services (TAAS) in such a way that risk-<br>based technical and functional specifications         | 8   |  |
| 1.e    | 4e(i)(E)                                  | Encrypting sensitive data such as credentials to the extent practicable and based on risk;  | Functional        | Intersects With      | Pre-Established Secure<br>Configurations                                 | TDA-02.4 | Mechanisms exist to ensure vendors /<br>manufacturers:<br>(1) Deliver the Technology Asset, Application<br>and/or Service (TAAS) with a pre-established,                                       | 8   |  |
| 1.e    | 4e(i)(E)                                  | Encrypting sensitive data such as credentials to the extent practicable and based on risk;  | Functional        | Intersects With      | Secure Software<br>Development Practices<br>(SSDP)                       | TDA-06   | Mechanisms exist to develop applications<br>based on Secure Software Development<br>Practices (SSDP).  | 8   |  |
| 1.f    | 4e(i)(F)                                  | Implementing defensive cybersecurity practices including continuous monitoring of operations and slerts and as necessary responding to suspected and confirmed cyber incidents;                       | Functional        | Subset Of            | Cybersecurity & Data<br>Protection Governance<br>Program                 | GOV-01   | Mechanisms exist to facilitate the implementation of cybersecurity and data protection governance controls.  | 10  |  |

|------|---|---|-------------------|----------------------|--|----------|--|---|------------------|
| 1.f  | 4e(i)(F)                                  | Implementing defensive cybersecurity practices including continuous monitoring of operations and alerts and as necessary responding to suspected and confirmed cyber incidents;   | Functional        | Intersects With      | Operationalizing Cybersecurity & Data Protection Practices           | GOV-15   | Mechanisms exist to compel data and/or process owners to operationalize cybersecurity and data protection practices for each Technology Asset, Application and/or                            | 5   |                  |
| 1.f  | 4e(i)(F)                                  | Implementing defensive cybersecurity practices including continuous monitoring of operations and alerts and as necessary responding to suspected and confirmed cyber incidents;   | Functional        | Subset Of            | Continuous Monitoring  | MON-01   | Mechanisms exist to facilitate the implementation of enterprise-wide monitoring controls.  | 10  |                  |
| 1.f  | 4e(i)(F)                                  | Implementing defensive cybersecurity practices including continuous monitoring of operations and alerts and as necessary responding to suspected and confirmed cyber incidents;   | Functional        | Subset Of            | Incident Response<br>Operations                                      | IRO-01   | processes and documentation to facilitate an<br>organization-wide response capability for<br>cybersecurity and data protection-related   | 10  |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Product Management   | TDA-01.1 | Mechanisms exist to design and implement<br>product management processes to proactively<br>govern the design, development and<br>production of Technology Assets, Applications               | 8   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Development Methods,<br>Techniques & Processes                       | TDA-02.3 | Mechanisms exist to require software developers to ensure that their software development processes employ industry-recognized secure practices for secure                                   | 8   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Software Bill of Materials<br>(SBOM)                                 | TDA-04.2 | Mechanisms exist to generate, or obtain, a<br>Software Bill of Materials (SBOM) for<br>Technology Assets, Applications and/or<br>Services (TAAS) that lists software packages in             | 3   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Software Assurance<br>Maturity Model (SAMM)                          | TDA-06.3 | Mechanisms exist to utilize a Software<br>Assurance Maturity Model (SAMM) to govern a<br>secure development lifecycle for the<br>development of Technology Assets,                           | 3   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Supporting Toolchain   | TDA-06.4 | Automated mechanisms exist to improve the<br>accuracy, consistency and<br>comprehensiveness of secure practices<br>throughout the asset's lifecycle.   | 8   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Cybersecurity & Data<br>Protection Testing<br>Throughout Development | TDA-09   | Mechanisms exist to require system developers/integrators consult with cybersecurity and data protection personnel to:   | 3   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of<br>internal code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Software / Firmware<br>Integrity Verification                        | TDA-14.1 | Mechanisms exist to require developers of<br>Technology Assets, Applications and/or<br>Services (TAAS) to enable integrity verification<br>of software and firmware components.              | 3   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Developer Threat Analysis<br>& Flaw Remediation                      | TDA-15   | Mechanisms exist to require system<br>developers and integrators to create a Security<br>Test and Evaluation (ST&E) plan and<br>implement the plan under the witness of an                   | 5   |                  |
| 2    | 4e(iii)                                   | The software producer makes a goodfaith effort to maintain trusted source code supply chains<br>by employing automated tools or comparable processes to address the security of internal<br>code and third-party components and manage related vulnerabilities;           | Functional        | Intersects With      | Access to Program<br>Source Code                                     | TDA-20   | Mechanisms exist to limit privileges to change software resident within software libraries.  | 5   |                  |
| 3    | 4e(vi)                                    | The software producer maintains provenance for internal code and third-party components incorporated into the software to the greatest extent feasible;   | Functional        | Intersects With      | Access to Program<br>Source Code                                     | TDA-20   | Mechanisms exist to limit privileges to change software resident within software libraries.  | 5   |                  |
| 3    | 4e(vi)                                    | The software producer maintains provenance for internal code and third-party components incorporated into the software to the greatest extent feasible;   | Functional        | Intersects With      | Software Release Integrity<br>Verification                           | TDA-20.1 | Mechanisms exist to publish integrity verification information for software releases.  | 5   |                  |
| 3    | 4e(vi)                                    | The software producer maintains provenance for internal code and third-party components incorporated into the software to the greatest extent feasible;   | Functional        | Intersects With      | Software Escrow  | TDA-20.3 | Mechanisms exist to escrow source code and<br>supporting documentation to ensure software<br>availability in the event the software provider<br>goes out of business or is unable to provide | 5   |                  |
| 4    | 4e(iv)                                    | The software producer employed automated tools or comparable processes that check for security vulnerabilities. In addition:  | Functional        | Intersects With      | Cybersecurity & Data<br>Protection Testing<br>Throughout Development | TDA-09   | Mechanisms exist to require system<br>developers/integrators consult with<br>cybersecurity and data protection personnel<br>to:  | 8   |                  |
| 4    | 4e(iv)                                    | The software producer employed automated tools or comparable processes that check for security vulnerabilities. In addition:  | Functional        | Intersects With      | Static Code Analysis   | TDA-09.2 | Mechanisms exist to require the developers of<br>Technology Assets, Applications and/or<br>Services (TAAS) to employ static code analysis<br>tools to identify and remediate common flaws    | 3   |                  |
| 4    | 4e(iv)                                    | The software producer employed automated tools or comparable processes that check for security vulnerabilities. In addition:  | Functional        | Intersects With      | Dynamic Code Analysis  | TDA-09.3 | Mechanisms exist to require the developers of<br>Technology Assets, Applications and/or<br>Services (TAAS) to employ dynamic code<br>analysis tools to identify and remediate                | 3   |                  |
| 4.a  | 4e(iv)                                    | The software producer operates these processes on an ongoing basis and prior to product version or update releases;   | Functional        | Intersects With      | Cybersecurity & Data<br>Protection Testing<br>Throughout Development | TDA-09   | Mechanisms exist to require system<br>developers/integrators consult with<br>cybersecurity and data protection personnel<br>to:  | 8   |                  |
| 4.a  | 4e(iv)                                    | The software producer operates these processes on an ongoing basis and prior to product version or update releases;   | Functional        | Intersects With      | Developer Threat Analysis<br>& Flaw Remediation                      | TDA-15   | Mechanisms exist to require system developers and integrators to develop and implement a Security Testing and Evaluation (ST&E) plan to objectively identify and                             | 8   |                  |
| 4.b  | 4e(iv)                                    | The software producer has a policy or process to address discovered security vulnerabilities<br>prior to product release; and   | Functional        | Subset Of            | Technology Development & Acquisition                                 | TDA-01   | Mechanisms exist to facilitate the<br>implementation of tailored development and<br>acquisition strategies, contract tools and<br>procurement methods to meet unique                         | 10  |                  |
| 4.b  | 4e(iv)                                    | The software producer has a policy or process to address discovered security vulnerabilities prior to product release; and  | Functional        | Subset Of            | Vulnerability & Patch<br>Management Program<br>(VPMP)                | VPM-01   | Mechanisms exist to facilitate the<br>implementation and monitoring of vulnerability<br>management controls.   | 10  |                  |
| 4.b  | 4e(iv)                                    | The software producer has a policy or process to address discovered security vulnerabilities prior to product release; and  | Functional        | Intersects With      | Vulnerability Remediation<br>Process                                 | VPM-02   | Mechanisms exist to ensure that vulnerabilities<br>are properly identified, tracked and<br>remediated.   | 8   |                  |
| 4.c  | 4e(iv)                                    | The software producer operates a vulnerability disclosure program and accepts reviews and<br>addresses disclosed software vulnerabilities in a timely fashion and according to any timelines<br>specified in the vulnerability disclosure program or applicable policies. | Functional        | Subset Of            | Vulnerability Disclosure<br>Program (VDP)                            | THR-06   | Mechanisms exist to establish a Vulnerability<br>Disclosure Program (VDP) to assist with the<br>secure development and maintenance of<br>Technology Assets, Applications and/or              | 10  |                  |
| 4.c  | 4e(iv)                                    | The software producer operates a vulnerability disclosure program and accepts reviews and<br>addresses disclosed software vulnerabilities in a timely feshion and according to any timelines<br>specified in the vulnerability disclosure program or applicable policies. | Functional        | Intersects With      | Vulnerability Remediation<br>Process                                 | VPM-02   | Mechanisms exist to ensure that vulnerabilities<br>are properly identified, tracked and<br>remediated.   | 8   |                  |

Secure Controls Framework (SCF) 2012
